

How to build a web album using free software

Download the free software from <http://jalbum.net/>

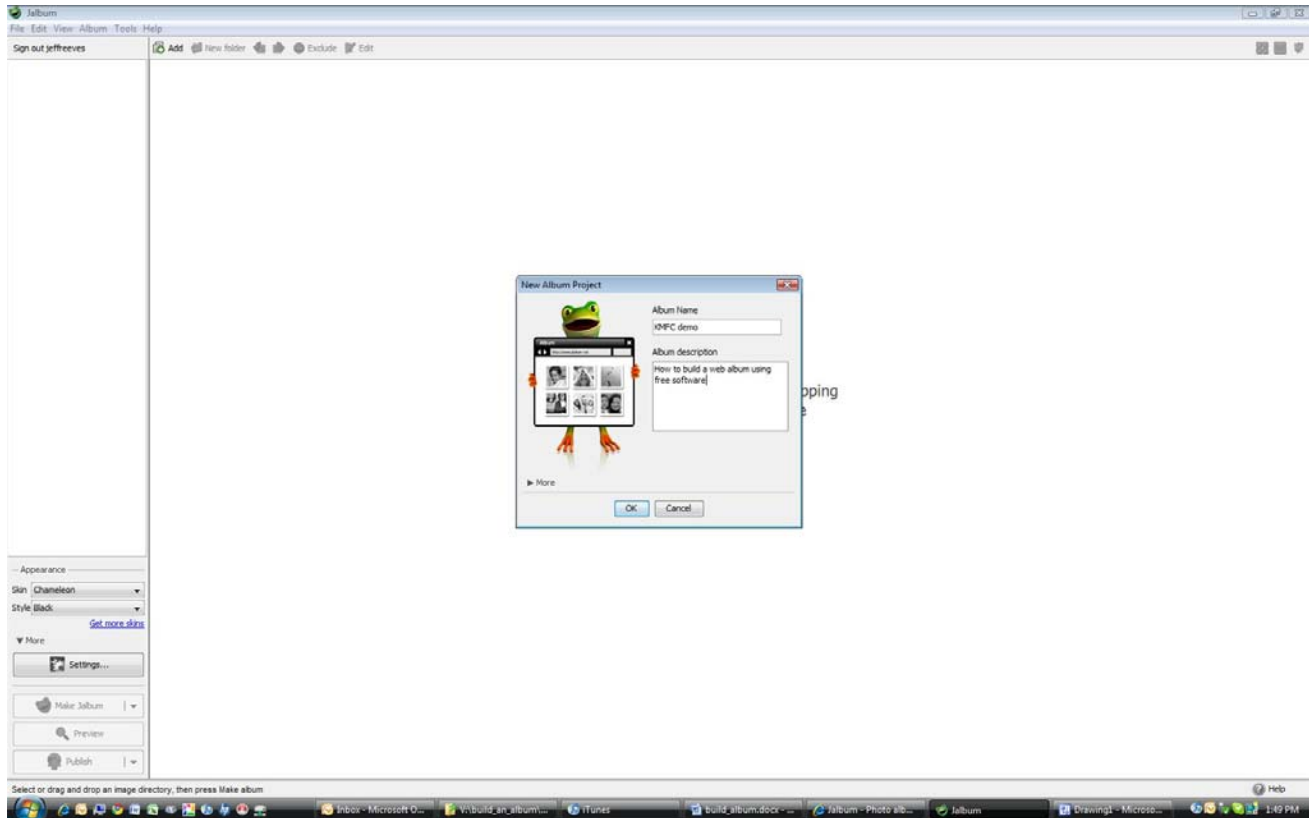

This is a three-step process resulting in the setting up of an account for you on Jalbum's site.

It is only 30mb but you can get a fairly good-sized album onto it.

How to build a web album using free software

Open the new Jalbum software and click *File* and then *New album project*

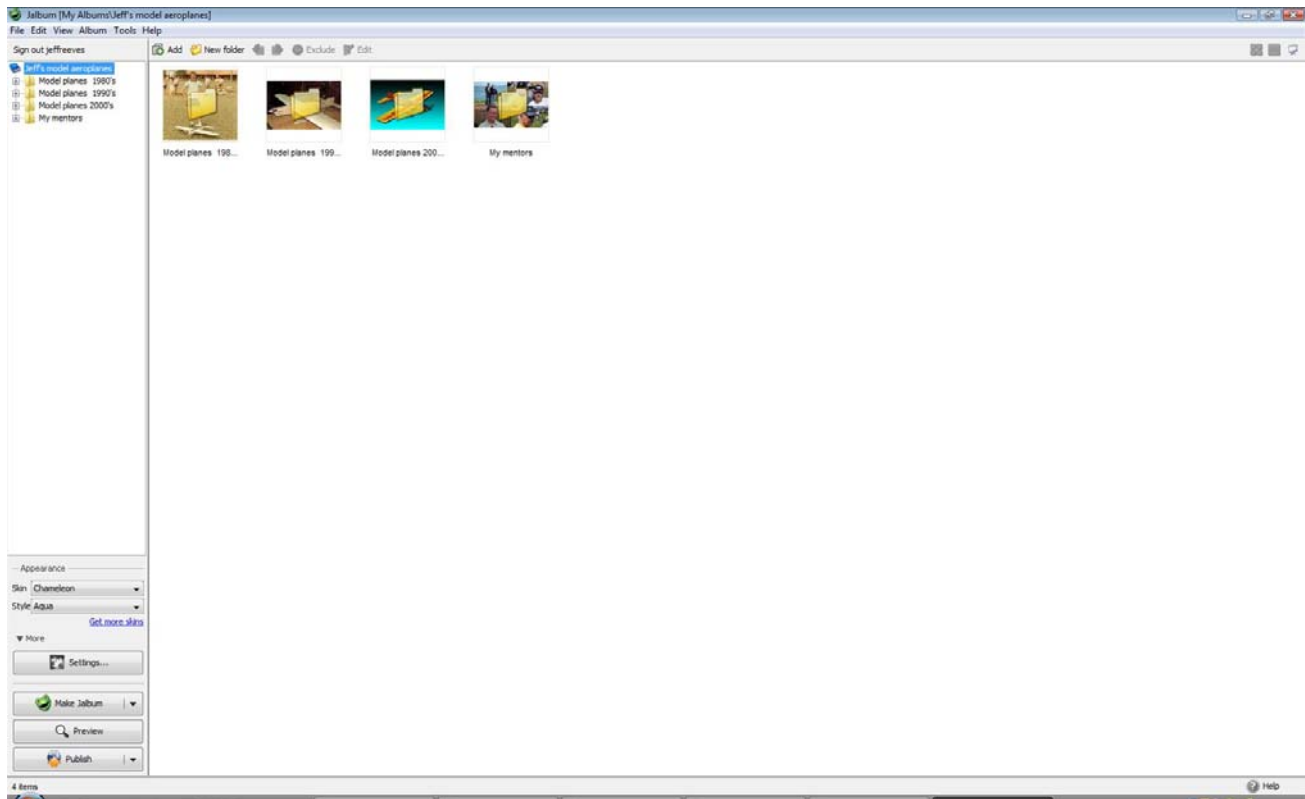

Type in the name of your album. Click OK.

I made mine "Jeff's model aeroplanes"

How to build a web album using free software

Organise your photos into logical areas by clicking *New folder* for each area

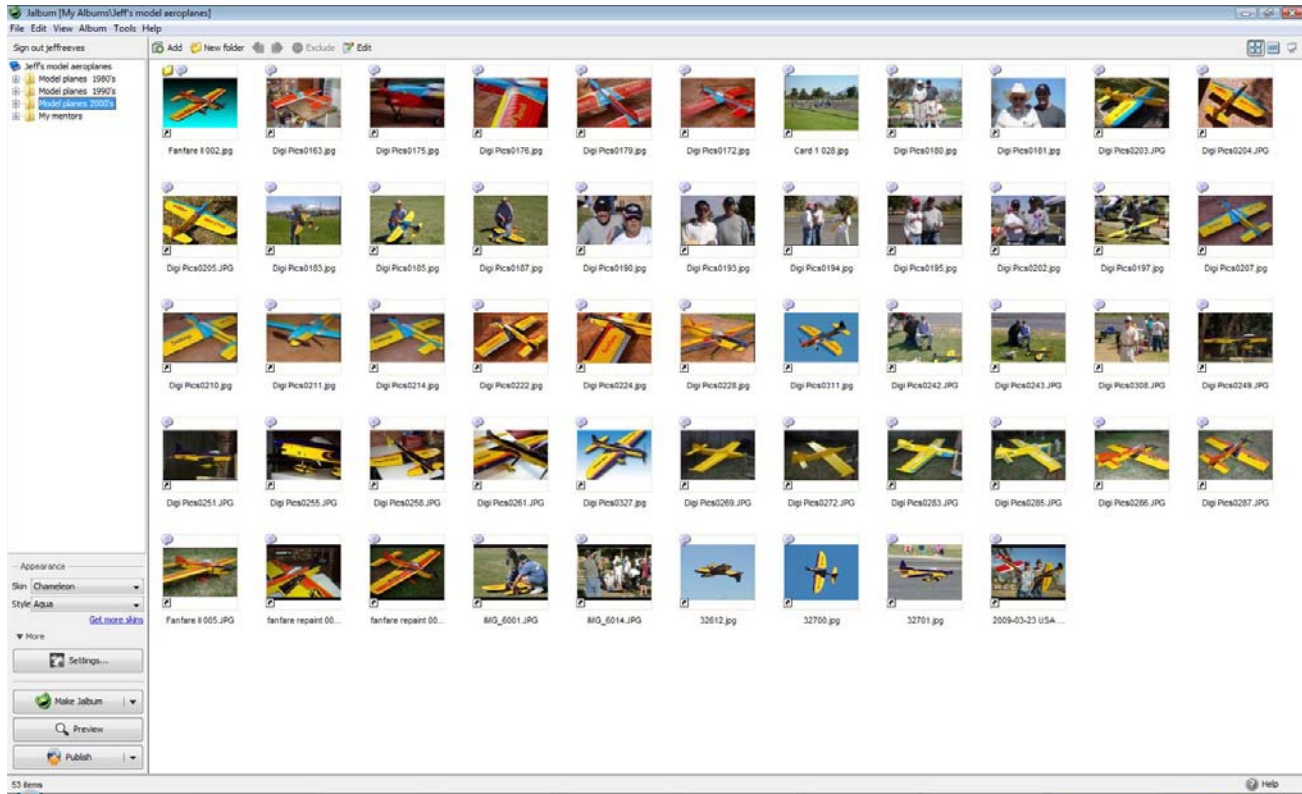

On my site, I divided my aeroplanes into decades.

I used an option found under *Settings* in Jalbum that used the first photograph in each folder as a picture for the folder (but you're not there yet – no photos in folders yet).

How to build a web album using free software

Click on a folder name to open that folder

Click the *Add* button and add your photos into the folder

The photos you add are the photos you have already stored on your computer in a folder called *Pictures* or *My pictures*, something like that.

Do not be concerned about the file size of each photo being too large. Jalbum reduces their size to make them web-friendly.

Also notice that I stuck the picture that I want to display as the folder image in the first position.

Double click on a photo to open the large window for that image.

How to build a web album using free software

Add details to each image

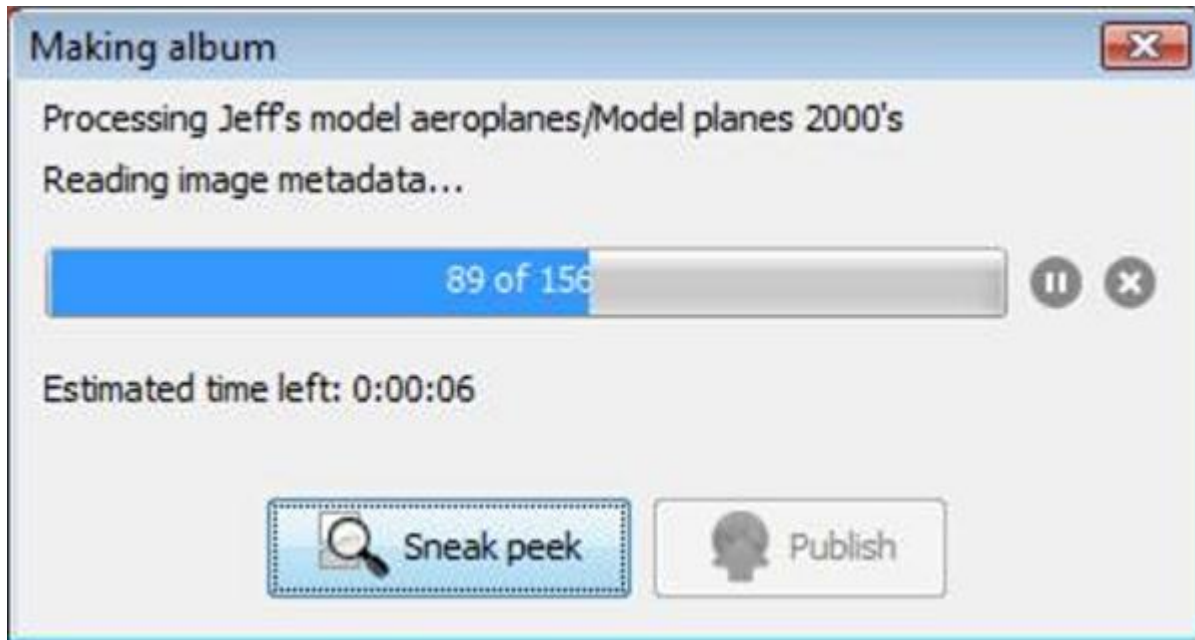

Here you can add details about each picture. In the window above I added some details about the balance point being too far forward.

You can also use the tools on the right to alter the image. For example: you can crop the image, get rid of red eye, etc.

The original image in your *Pictures* folder remains untouched.

How to build a web album using free software

Create your album by clicking the *Make Jalbum* button

This step creates a new set of images and stores them in a separate folder, for example: *My Albums* in Windows Vista.

It also creates all of the HTML* pages your album requires, one HTML page for each picture. Each HTML page contains a reduced image suitable for the web, navigation buttons, details about the picture that you may have added, etc.

**Hypertext Markup Language* is a popular language that all Web Browsers recognise.

Now you can publish your album on the internet

Select the site that Jalbum has assigned to you and click the *Connect* button.

How to build a web album using free software

Once you are connected to the Jalbum site, click the *Upload* button to publish your album

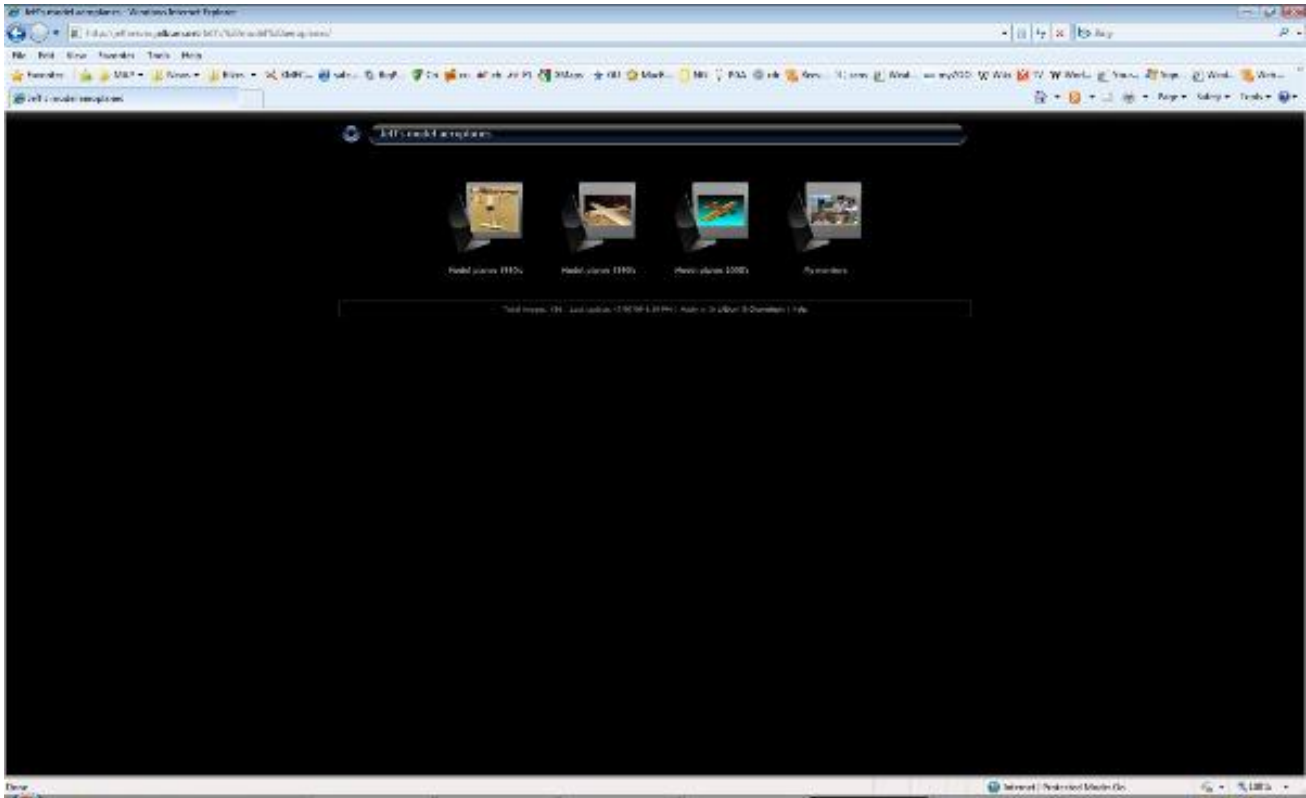

The address being used as the upload target is displayed at the bottom of this window

When Jalbum has finished uploading your album, click on this link to view your album on the internet.

How to build a web album using free software

Your album opens on the internet for the whole world to see

If you want me to publish your album on the KMFC web site, Copy the address in the address bar (highlight with your mouse, right click, click Copy) and Paste the address into an [email to me.](#))

If you'd like to view my album, [click here.](#)
